16. ABSTRACT
Annual total phosphorus and total nitrogen loadings to the lake were estimated and subdivided according to either point or non-point source origin. An assessment of the lake's trophic condition and limiting nutrient is also provided. All data collected by the U.S.E.P.A. National Eutrophication Survey during the one year study of the lake and its tributaries are included in the report.

FOREWORD

The National Eutrophication Survey was initiated in 1972 in response to an Administration commitment to investigate the nationwide threat of accelerated eutrophication to freshwater lakes and reservoirs.

OBJECTIVES

The Survey was designed to develop, in conjunction with state environmental agencies, information on nutrient sources, concentrations, and impact on selected freshwater lakes as a basis for formulating comprehensive and coordinated national, regional, and state management practices relating to point-source discharge reduction and non-point source pollution abatement in lake watersheds.

ANALYTIC APPROACH

The mathematical and statistical procedures selected for the Survey's eutrophication analysis are based on related concepts that:

a. A generalized representation or model relating sources, concentrations, and impacts can be constructed.

b. By applying measurements of relevant parameters associated with lake degradation, the generalized model can be transformed into an operational representation of a lake, its drainage basin, and related nutrients.

c. With such a transformation, an assessment of the potential for eutrophication control can be made.

LAKE ANALYSIS

In this report, the first stage of evaluation of lake and watershed data collected from the study lake and its drainage basin is documented. The report is formatted to provide state environmental agencies with specific information for basin planning [§303(e)], water quality criteria/standards review [§303(c)], clean lakes [§314(a,b)], and water quality monitoring [§106 and §305(b)] activities mandated by the Federal Water Pollution Control Act Amendments of 1972.

Beyond the single lake analysis, broader based correlations between nutrient concentrations (and loading) and trophic condition are being made to advance the rationale and data base for refinement of nutrient water quality criteria for the Nation's fresh water lakes. Likewise, multivariate evaluations for the relationships between land use, nutrient export, and trophic condition, by lake class or use, are being developed to assist in the formulation of planning guidelines and policies by EPA and to augment plans implementation by the states.

ACKNOWLEDGEMENT

The staff of the National Eutrophication Survey (Office of Research and Development, U.S. Environmental Protection Agency) expresses sincere appreciation to the Utah Department of Social Services and the Utah Department of Natural Resources for professional involvement, to the Utah National Guard for conducting the tributary sampling phase of the Survey, and to those Utah wastewater treatment plant operators who voluntarily provided effluent samples and flow data.

The staffs of the Bureau of Water Quality of the Division of Health and the Division of Wildlife Resources provided invaluable lake documentation and counsel during the Survey, reviewed the preliminary reports, and provided critiques most useful in the preparation of this Working Paper series.

Major General Maurice L. Watts, the Adjutant General of Utah, and Project Officer Lt. Colonel T. Ray Kingston, who directed the volunteer efforts of the Utah National Guardsmen, are also gratefully acknowledged for their assistance to the Survey.

LYNN RESERVOIR

STORET NO. 4905

I. INTRODUCTION

Lynn Reservoir was included in the National Eutrophication Survey as a water body of interest to the Utah Bureau of Environmental Health. Tributaries were not sampled, and this report primarily relates to the reservoir sampling data.

II. CONCLUSIONS

A. Trophic Condition:

Survey data indicate Lynn Reservoir is eutrophic. It ranked twenty-fourth in overall trophic quality when the 27 Utah lakes and reservoirs sampled in 1975 were compared using a combination of six parameters*. Twenty-four of the water bodies had less median total phosphorus, 25 had less median dissolved ortho-phosphorus, 20 had less median inorganic nitrogen, 24 had less mean chlorophyll a, and 11 had greater mean Secchi disc transparency. Some depression of dissolved oxygen with depth occurred in August (4.6 mg/l at 5.5 meters).

Survey limnologists observed an algal bloom in the reservoir in September.

B. Rate-Limiting Nutrient:

The algal assay results indicate the reservoir was nitrogen limited in September.

The reservoir data indicate nitrogen limitation all three sampling times.

---

* See Appendix A.

III. RESERVOIR AND DRAINAGE BASIN CHARACTERISTICS†

A. Morphometry: Unknown.

B. Precipitation*:

1. Year of sampling: 49.4 centimeters.

2. Mean annual: 44.7 centimeters.

† Table of metric equivalents--Appendix B.
* See Working Paper No. 175, "... Survey Methods, 1973-1976".

IV. WATER QUALITY SUMMARY

Lynn Reservoir was sampled three times during the open-water season of 1975 by means of a pontoon-equipped Huey helicopter. Each time, samples for physical and chemical parameters were collected from two or more depths at one station on the reservoir (see map, page v). During each visit, a single depth-integrated (4.6 m or near bottom to surface) sample was collected for phytoplankton identification and enumeration, and a similar sample was taken for chlorophyll a analysis. During the last visit, a single 18.9-liter depth-integrated sample was collected for algal assays. The maximum depth sampled was 5.5 meters.

The sampling results are presented in full in Appendix C and are summarized in the following table.

B. Biological characteristics:

1. Phytoplankton -

Sampling Date	Dominant Genera	Algal Units per ml
05/15/75	1. Navicula sp.	239
	2. Phormidium sp.	159
	3. Pandorina sp.	106
	4. Cryptomonas sp.	80
	5. Trachelomonas sp.	27
	Other genera	132
	Total	743
08/05/75	1. Melosira sp.	386
	2. Schroederia sp.	15
	Total	401
09/17/75	1. Aphanizomenon sp.	7,130
	2. Synedra sp.	4,045
	3. Diatoma sp.	548
	4. Anabaena sp.	548
	5. Asterionella sp.	480
	Other genera	2,058
	Total	14,809

2. Chlorophyll a -

Sampling Date	Station Number	Chlorophyll a (µg/l)
05/15/75	1	3.0
08/05/75	1	2.3
09/17/75	1	113.5

C. Limiting Nutrient Study:

1. Autoclaved, filtered, and nutrient spiked -

Spike (mg/l)	Ortho P Conc. (mg/l)	Inorganic N Conc. (mg/l)	Maximum yield (mg/l-dry wt.)
Control	0.135	0.328	12.4
0.050 P	0.185	0.328	12.0
0.050 P + 1.0 N	0.185	1.328	37.0
1.0 N	0.135	1.328	29.4

2. Discussion -

The control yield of the assay alga, Selenastrum capricornutum, indicates that the potential primary productivity of Lynn Reservoir was very high at the time the sample was collected (09/17/76). Also, the significant increase in yield when only nitrogen was added, and the lack of yield response when phosphorus alone was added, indicate the reservoir was nitrogen limited at that time.

The reservoir data indicate nitrogen limitation all three sampling times; i.e., the mean inorganic nitrogen to orthophosphorus ratios were 8 to 1 in May, 1 to 1 in August, and 2 to 1 in September.
